## TRAINING

Everything must be fully justified on the basis of the definitions or the appendix.

## **Exercise** Rotating Disk

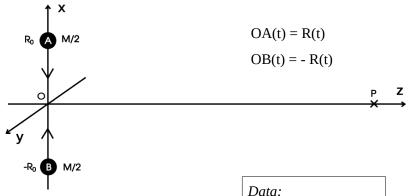

- 1) Give the Minkowskian metric in cylindrical coordinates.
- 2) From the metric of Minkowski and the appropriate change of coordinates, find the following metric on the rotating disk:

$$ds^{2} = \left(1 - \frac{\rho^{2} \omega^{2}}{c^{2}}\right) c^{2} dt^{2} - 2 \rho^{2} \omega dt d\theta - d\rho^{2} - \rho^{2} d\theta^{2} \quad \text{with} \quad z = 0.$$

- 3) Use the Lagrangian formalism to establish the equations of motion for  $\rho(t)$  and  $\theta(t)$ .
- 4) Show that there is no radial trajectory for a free particle in the disk frame. Similarly, show that there are no circular trajectories in the disk reference frame, apart from the trivial case where the particle is at rest in the laboratory.

## **Problem** Collapsing Star

Let's consider a simple model of gravitational wave (GW) emission during the collapse of a star into a black hole. The mass of the star is denoted M. The star is assumed to be split into two masses M/2. At t=0, the masses are at rest and at a distance  $2\,R_0$ . Then, the two parts of the star fall radially with respect to each other until they reach the Schwarzschild distance.

- 1) Calculate the quadrupole moment  $I_{ii}$ .
- 2) Express the GW amplitude  $h_{ij}$  observed at  $P(r=OP >> R_0)$ .
- 3) Is  $h_{ij}$  Transverse and Traceless? If not, make the necessary changes.
- 4) What's the polarization of the GW?
- 5) Use Newton's mechanics to prove that  $\ddot{R}^2 = GM \left( \frac{3}{4R} \frac{1}{R_0} \right)$ .

- $M=30M_{\rm S}$   $M_{\rm S}=2\times10^{30}{\rm kg}$   $G\sim7\times10^{-11}{\rm IS}$   $1{\rm ly}\sim10^{16}{\rm m}$  Milky~Way:  $size\sim100~000~{\rm ly}$  Andromeda~Galaxy:  $distance\sim3Mly$
- 6) Find the maximal amplitude h of the wave emitted at the end of the collapse ( $R_0 >> r_s$ ). The minimal amplitude detected on Earth is  $h_{min} \simeq 10^{-23}$ . Could this collapse be detected in our galaxy or in others?

## APPENDIX:

GW, weak field: 
$$h_{ij}^{TT}(t) = \frac{2G}{rc^4} \frac{d^2 I_{ij}(t-r/c)}{dt^2}$$
 with  $I_{ij} = \int_{source} x_i x_j \rho dV$ 

Schwarzschild Radius: 
$$r_s = \frac{2GM}{c^2}$$
